

Community Sports Management System

Ross D. Gardler, ross@saafe.org

1 Introduction

The **Community Sports Management System** sports league management system allowing the creation of leagues and the management of teams and players within those leagues together with all the stats generated in games. The core system is sport agnostic and is extended to support individual sports with the add on of sport modules. We aim to support as many sports as possible, both real and fantasy. The software also provides mechanisms for supporting online communities based around each sport, league and team.

1.1 Our Mission

The Community Sports Management System project aims to facilitate the online management of sporting seasons, bringing together its participants and encouraging collaboration between like-minded groups.

In doing this we aim to promote the growth and development of sports clubs of all types and encourage the participation of all people whether they be players, organisers or supporters.
